A chemical reactor is an enclosed volume in which a chemical reaction takes place. In chemical engineering, it is generally understood to be a process vessel used to carry out a chemical reaction, which is one of the classic unit operations in chemical process analysis. The design of a chemical reactor deals with multiple aspects of chemical engineering.

ABSTRACT. This work presents an experimental study of purification of a biogas by removal of its hydrogen sulphide (H_2S) content. The H_2S was removed by means of chemical absorption in an iron-chelated solution catalyzed by Fe/EDTA, which converts H_2S into elemental sulphur (S). Preparation of the catalyst solution and the results of biogas component absorption in the catalyst solution ...

The objective of this work is to investigate the production of hydrogen as an energy source by means of the reaction of aluminum with water. This reaction only occurs in the presence of NaOH and KOH, which behave as catalysts. The main advantages of using aluminum for indirect energy storage are ...

For material flowing through a volume, the residence time is a measure of how much time the matter spends in it. Examples include fluids in a chemical reactor, specific elements in a geochemical reservoir, water in a catchment, bacteria in a culture vessel and drugs in human body. A molecule or small parcel of fluid has a single residence time, but more complex systems have a residence time ...

1. Introduction. Modern chemical gas sensors (e.g. chemoresistive SnO_2) are particularly suitable for hand-held breath analyzers or indoor air monitors due to their extremely compact design, simple application and low cost in contrast to gas chromatography/mass spectrometry-based techniques. While featuring sufficiently low detection limits, however, their lack of selectivity remains a ...
